#### Abstract

This paper concerns with the formulation of sequences of Diophantine 3-tuples with property $\mathrm{D}\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right)$ through matrix method.

KEY WORDS: Diophantine 3-tuple, Sequence of Diophantine 3-tuples, Matrix application

## INTRODUCTION

A theory that can be explained in a regular and systematic way is a pattern. The essence of mathematical calculations is represented by numbers and the theory of numbers can be taught as a set of patterns [1-4]. It is to be noted here that the number pattern is a sequence of numbers establishing a same properties among them. Numbers exhibit fascinating, beautiful and curious varieties of patterns, namely, polygonal numbers, Fibonacci numbers, Lucas numbers, Ramanujan numbers, Kynea numbers, Jacobsthal numbers and so on. Let $S$ be a set of m non-zero distinct integers $\left(\mathrm{a}_{1}, \mathrm{a}_{2}, \mathrm{a}_{3}, \ldots . \mathrm{a}_{\mathrm{m}}\right)$ have the property $D(n), n \in Z-\{0\}$ if $a_{i} a_{j}+n$ is a perfect square for all $1 \leq i<j \leq m$ or $1 \leq j<i \leq m$ and such a set S is called a Diophantine m-tuple with property $D(n)$. For illustration see [5-14]. This paper exhibits the construction of sequence of Diophantine 3-tuples with property $\mathrm{D}\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right)$ through matrix method.

## METHOD OF ANALYSIS

Initially, construct a diophantine 2-tuple with property $\mathrm{D}\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right)$ and then, extend it to diophantine 3-tuple.
Let 4,7 be two distinct integers such that

$$
4 * 7+\mathrm{k}^{2}+10 \mathrm{k}-3=(\mathrm{k}+5)^{2}, \text { a perfect square }
$$

Therefore, the pair $(4,7)$ exhibits diophantine double having property $\mathrm{D}\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right)$.

If $c$ is the $3^{\text {rd }}$ tuple, then it satisfies corresponding double equations

$$
\begin{align*}
& 4 \mathrm{c}+\mathrm{k}^{2}+10 \mathrm{k}-3=\mathrm{p}^{2}  \tag{1}\\
& 7 \mathrm{c}+\mathrm{k}^{2}+10 \mathrm{k}-3=\mathrm{q}^{2} \tag{2}
\end{align*}
$$

The eliminant of c in the above two equations leads to

$$
\begin{equation*}
7 \mathrm{p}^{2}-4 \mathrm{q}^{2}=3\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right) \tag{3}
\end{equation*}
$$

Taking

$$
\begin{equation*}
\mathrm{p}=\mathrm{X}+4 \mathrm{~T}, \mathrm{q}=\mathrm{X}+7 \mathrm{~T} \tag{4}
\end{equation*}
$$

in (3) and simplifying, we get

$$
\mathrm{X}^{2}=28 \mathrm{~T}^{2}+\mathrm{k}^{2}+10 \mathrm{k}-3
$$

which is satisfied by $T=1, X=k+5$

From (4) and (1), observe

$$
\mathrm{c}=2 \mathrm{k}+21
$$

Note that $(4,7,2 k+21)$ is a diophantine triple satisfying the property $D\left(k^{2}+10 k-3\right)$
The process of obtaining other diophantine triples with property $D\left(k^{2}+10 k-3\right)$ is illustrated below:

Let $M$ be a $3 \times 3$ square matrix given by

$$
M=\left(\begin{array}{rrr}
1 & 0 & 2  \tag{5}\\
0 & 0 & -1 \\
0 & 1 & 2
\end{array}\right)
$$

Now,

$$
(4,7,2 \mathrm{k}+21) \mathrm{M}=(4,2 \mathrm{k}+21,4 \mathrm{k}+43)
$$

Note that

$$
\begin{aligned}
& 4 *(2 \mathrm{k}+21)+\mathrm{k}^{2}+10 \mathrm{k}-3=(\mathrm{k}+9)^{2} \\
& 4 *(4 \mathrm{k}+43)+\mathrm{k}^{2}+10 \mathrm{k}-3=(\mathrm{k}+13)^{2} \\
& (2 \mathrm{k}+21) *(4 \mathrm{k}+43)+\mathrm{k}^{2}+10 \mathrm{k}-3=(3 \mathrm{k}+30)^{2}
\end{aligned}
$$

$\therefore$ The triple $(4,2 \mathrm{k}+21,4 \mathrm{k}+43)$ is a diophantine triple having the property $\mathrm{D}\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right)$.
Performing the above analysis, the general form of diophantine triple $\left(4, \mathrm{c}_{\mathrm{s}-1}, \mathrm{c}_{\mathrm{s}}\right)$ is given by

$$
\left(4,4 s^{2}+(2 k+2) s-2 k+1,4(s+1)^{2}+(2 k+2) s+3\right), s=1,2,3 \ldots \ldots .
$$

A few numerical illustrations are given in table 1 below:
Table 1: Numerical Illustrations

| $\mathbf{k}$ | $\left(4, \mathrm{c}_{0}, \mathrm{c}_{1}\right)$ | $\left(4, \mathrm{c}_{1}, \mathrm{c}_{2}\right)$ | $\left(4, \mathrm{c}_{2}, \mathrm{c}_{3}\right)$ | $\mathrm{D}\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right)$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | $(4,7,21)$ | $(4,21,43)$ | $(4,43,73)$ | $\mathrm{D}(-3)$ |
| -1 | $(4,7,19)$ | $(4,19,39)$ | $(4,39,67)$ | $\mathrm{D}(-12)$ |
| -2 | $(4,7,17)$ | $(4,17,35)$ | $(4,35,61)$ | $\mathrm{D}(-19)$ |
| -3 | $(4,7,15)$ | $(4,15,31)$ | $(4,31,55)$ | $\mathrm{D}(-24)$ |
| 1 | $(4,7,23)$ | $(4,23,47)$ | $(4,47,79)$ | $\mathrm{D}(8)$ |

It is noted that the triple $\left(\mathrm{c}_{\mathrm{s}-1}, \mathrm{c}_{\mathrm{s}}+4, \mathrm{c}_{\mathrm{s}+1}\right), \mathrm{s}=1,2,3 \ldots \ldots .$. forms an arithmetic progression.

## Note 1:

It is obvious that $(7,4,2 k+21)$ is a Diophantine 3 -tuples with property $\mathrm{D}\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right)$.
Following the procedure as above, the Diophantine triples obtained are $(7,4,2 \mathrm{k}+21),(7,2 \mathrm{k}+21,4 \mathrm{k}+52)$, $(19,4 k+52,6 k+97), \ldots \ldots \ldots \ldots .$. each with property $D\left(k^{2}+10 k-3\right)$ whose general form $\left(7, c_{s-1}, c_{s}\right)$ is $\left(7,7 \mathrm{~s}^{2}+(2 k-4) \mathrm{s}-2 \mathrm{k}+1,7(\mathrm{~s}+1)^{2}+(2 \mathrm{k}-4) \mathrm{s}-3\right), \mathrm{s}=1,2,3 \ldots \ldots$.

Note that $\left(c_{s-1}, c_{s}+7, c_{s+1}\right)$ forms an Arithmetic Progression.

## Note 2:

In addition to (4), one may consider the linear transformation given by

$$
p=X-4 T, q=X-7 T
$$

For this case, employing the procedure as above one obtains two sets of sequences of Diophantine 3-tuples in which, each triple has the property $\mathrm{D}\left(\mathrm{k}^{2}+10 \mathrm{k}-3\right)$. For simplicity and brevity, the general form of the triple in the sequence of Diophantine 3-tuples is presented:

Set 1: $\left(4, \alpha_{\mathrm{s}-1}, \alpha_{\mathrm{s}}\right)$ where $\alpha_{\mathrm{s}-1}=4 \mathrm{~s}^{2}+(-2 \mathrm{k}-18) \mathrm{s}+2 \mathrm{k}+21, \mathrm{~s}=1,2,3 \ldots \ldots$.

Note that $\left(\alpha_{\mathrm{s}-1}, \alpha_{\mathrm{s}}+4, \alpha_{\mathrm{s}+1}\right)$ forms an Arithmetic Progression.

Set 2: $\left(7, \alpha_{\mathrm{s}-1}, \alpha_{\mathrm{s}}\right)$ where $\alpha_{\mathrm{s}-1}=7 \mathrm{~s}^{2}+(-2 \mathrm{k}-24) \mathrm{s}+2 \mathrm{k}+21, \mathrm{~s}=1,2,3 \ldots \ldots$.

Note that $\left(\alpha_{\mathrm{s}-1}, \alpha_{\mathrm{s}}+7, \alpha_{\mathrm{s}+1}\right)$ forms an Arithmetic Progression.

## Remark:

Instead of (5), suppose we have a third order square matrix N given by

$$
\mathrm{N}=\left(\begin{array}{rrr}
0 & 0 & -1 \\
1 & 0 & 2 \\
0 & 1 & 2
\end{array}\right)
$$

Following the procedure presented above, one obtains 4 more sets of Diophantine triples, each with property
$D\left(k^{2}+10 k-3\right)$.
To conclude, one may search for other choices of Matrices for the formulation of collections of Diophantine triples with suitable properties.
